

ABOUT

This project aims to highlight my personal interests in a professional career, as well as showcase a concrete product as a direct result of those interests. The culmination is a full-stack project, combining the different pillars in my programming understanding into a functional website. My final deliverable is a functioning site using HTML for the frontend, R and SQLite for the backend, powered by Baseball Savant, and continuously updated throughout the MLB regular and postseason.

DEVELOPMENT APPROACH

After over a decade of casual interest in baseball data analysis, I've finally channeled that love into what might be the first step in a long analytics career. The primary challenge was learning various skills from scratch, such as database management and connecting that database to a continuously running service that updates it over time. On top of that, the commitment to a heavy, long-term project like this helped give me a healthy perspective on how to manage a months-long workload and keep a persistent mindset towards finishing it over time.

TIMELINE:

I intend to complete a preliminary product with plans to expand the scale and scope of it after the initial release. Expansion plans include implementation of AWS cloud services like S3, Glue, and Athena to work in tandem with my programmed stack.

Database initialization code: 98% complete; final rounds of testing in progress.

Database-to-frontend API code: >85% complete; framework completed with more testing to come as frontend comes together.

Frontend code: coming soon!

AWS segment: >1% complete; implementation has only just begun!
