

ABOUT

This project aims to highlight my personal interests in a professional career, as well as showcase a concrete product as a direct result of those interests. The culmination is a full-stack project, combining the different pillars in my programming understanding into a functional website. My final deliverable is a functioning site using HTML for the frontend, R and SQLite for the backend, powered by Baseball Savant, and continuously updated throughout the MLB regular and postseason using Plumber.

PROCESS DEVELOPMENT

After over a decade of casual interest in baseball data analysis, I've finally channeled that love into what might be the first step in a long analytics career. The primary challenge was learning various skills from scratch, such as database management and connecting it to a continuous, live-updating service. On top of that, committing to a heavy long-term project like this helped give me a healthy perspective on how to manage a workload that would take months and keep a persistent mindset towards finishing it over time, instead of all at once. As of now, the repository contains several folders to be filled with the various pillars of the project: firstly, the initial database construction, followed by the Plumber pipeline to keep that database up-to-date, and finally the front-end to link the two to a visual format.
